Plasma and sputum concentrations of tenidap in the treatment of patients with active tuberculosis. Tenidap (6-(3-methyl-2-thiazolyl)-1-methyl-1,2,4-triazin-3(2H)-one) is an orally active, non-steroidal anti-inflammatory drug which is also approved for the treatment of rheumatoid arthritis. Its mechanism of action is unknown. In this study, the disposition of tenidap was examined in seven patients with active tuberculosis and three control subjects. Patients and controls received 600 mg oral doses of tenidap at the peak concentrations of 600 mg.h<sup>-1</sup> in plasma. The patients were receiving concomitant antituberculosis chemotherapy with isoniazid, rifampicin, pyrazinamide, and ethambutol. Blood samples were drawn up to 48 h post dose, and sputum was obtained at 24 and 48 h post dose. Tenidap and its primary metabolite, 3-(3-methyl-2-thiazolyl)-1-methyl-1,2,4-triazin-3(2H)-one (M1), were measured by high-performance liquid chromatography. Plasma concentrations of tenidap were determined using a validated, sensitive and specific reverse phase high-performance liquid chromatography method. Plasma concentrations of tenidap and M1 increased rapidly following drug administration. After 24 h, mean (+/- SD) plasma concentrations of tenidap and M1 were 163 +/- 22 and 5.7 +/- 3.7 micrograms.ml<sup>-1</sup>, respectively, in patients, and 146 +/- 56 and 2.9 +/- 1.9 micrograms.ml<sup>-1</sup>, respectively, in controls. Mean (+/- SD) sputum concentrations of tenidap and M1 at 48 h post dose were 0.6 +/- 0.3 and 1.3 +/- 0.9 micrograms.ml<sup>-1</sup>, respectively, in patients, and 0.7 +/- 0.4 and 0.8 +/- 0.3 micrograms.ml<sup>-1</sup>, respectively, in controls. Plasma and sputum concentrations of tenidap at 24 and 48 h were significantly (P
