Through our creative work, we offer an opportunity for individual expression and awareness to those that share the same passion.Q: Is this the right way to do using @JsonProperty for a ViewModel? I have a a ViewModel which represents the state of a page. It has some properties that are mapped to the corresponding fields on the view. I want to annotate some of these properties. I did read that in some cases we should use @JsonAutoDetect annotations. So should I continue using @JsonProperty annotations for the following: @JsonProperty("count") @JsonProperty("text") @JsonProperty("text") @JsonProperty("image") A: Yes, this is the right way. In addition to @JsonProperty you should also use @JsonIgnore on a property to automatically exclude it from the serialization. When to use @JsonIgnore A final note on serialization of a property is on the use of @JsonIgnore. I don't recommend ignoring a property unless it has no effect whatsoever on a given user's data. Usually there are better solutions to get your job done. If you find yourself serializing a property for serialization and deserializing a property to deserialize, then you probably should remove it from the annotated class. This is usually an indication that the property is not essential to the class or a result of bad design. In all cases, you should attempt to find a better solution. see this article about JsonAutoDetect for more info Being stuck on a desert island was a common feature in old sixties and seventies B-movies. A chance for the protagonists to learn something about life and how to get along in such an environment. In this short story about a girl, "
